PROFESSIONAL SUMMARY

Senior Software Engineer with 7+ years building backend services, data pipelines, full-stack applications, and developer tools in enterprise production environments. Led C# and Python platform work at Intel that cut root-cause analysis time by **80%**, enabled **\$30M in cost avoidance**, and reduced deployment time by **90%**. Now ships production features and develops AI agents for internal developer workflows at UKG.

CORE COMPETENCIES

C# and .NET

Python Backend Services

REST API Design

SQL and Data Pipelines

CI/CD and Production Operations

Distributed Services

AI/ML Integration

Technical Leadership

WORK EXPERIENCE

UKG July 2026 - Present

Senior Software Engineer

- Maintain and extend an established production application using Angular, C#, and SQL, shipping new features across its full stack.
- Develop AI agents to improve internal developer workflows.

Intel March 2020 - October 2025

Senior Data Analytics Software Engineer

- Architected C# and Python backend and analytics services for automated root-cause analysis in large-scale semiconductor manufacturing environments.
- Led a team of 4 engineers building a production analytics platform that reduced time-to-root-cause by **approximately 80%** through better signal identification and data workflows.
- Designed data and ML-enabled pipelines with feature engineering across **100k+ features** and production model integration, generating **\$30M in cost avoidance** through early anomaly detection and excursion prevention.
- Built and deployed an internal developer assistance platform using RAG and ChatGPT, improving code retrieval accuracy by **approximately 70%**.
- Owned GitLab and GitHub CI/CD across multiple applications, cutting deployment time by **approximately 90%**, reducing production defects by **approximately 40%**, and administering **40+ Windows Servers** across distributed sites.
- Introduced SCRUM practices that increased sprint velocity by **approximately 45%**; led Sprint Review and Backlog sessions and mentored 5 junior engineers.

Intel May 2018 - March 2020

Software Engineer

- Developed analytics and statistical analysis applications for reliability modeling and failure-rate analysis.
- Improved analytical algorithms to deliver **3x performance** and reduce defect rates.
- Designed reusable application frameworks for consistent access to backend analytics and data services, and implemented CI/CD automation.

PROJECTS

Job Matcher Personal Project

Built a privacy-focused job search pipeline that fetches listings from 9 sources and scores full job descriptions against a skills profile. Added multi-provider failover, cost-per-call tracking, and a local web interface. christopherbeaulieu.net/job-matcher
Python, Flask, SQLite, HTMX, Pydantic, Claude API, OpenAI API, Gemini API

Siege Assignment Web App Live Application

Built a clan management application with a drag-and-drop assignment board, auto-fill algorithm, real-time validation, Playwright PNG generation, Discord DM delivery, and Discord OAuth.
FastAPI, React, TypeScript, PostgreSQL, Docker, Azure Container Apps

EDUCATION

Master of Science, Computer Engineering	Georgia Institute of Technology	2018
Bachelor of Science, Computer Engineering	Georgia Institute of Technology	2016

TECHNICAL SKILLS

Languages: C#, Python, C++, SQL **Backend and Web:** .NET Framework, .NET Core, ASP.NET, FastAPI, RESTful APIs, Angular
Data and ML: Data preparation pipelines, feature engineering, model integration, NumPy, Pandas, SQL Server, PostgreSQL
AI: Retrieval-Augmented Generation (RAG), LLM integration, prompt engineering, AI agent development
DevOps and Systems: Git, GitHub CI/CD, GitLab CI/CD, Microsoft Azure, Docker, Artifactory, Conan, Windows Server, Linux
